WINDOWS**

# Tips for **BRIGHT WINDOWS**

Kiilto provides a product range for effective and yet environmentally friendly products for achieving brighter windows.

The cleaning task can be made easier by using the right products and equipment. It is important to keep good ergonomics and safety in mind at every stage of the work.

STEP 1:  
**PLAN THE WORK**

STEP 2:  
**EQUIPMENT  
MATTERS**

STEP 3:  
**THE RIGHT ORDER**

STEP 4:  
**REMEMBER TO DRY**

## STEP 1: PLAN THE WORK

Check the condition of the equipment before starting. Clear the area in front of the windows and protect furniture and surfaces from splashes and runoff.

## STEP 2: EQUIPMENT MATTERS

Window cleaning is easier and faster with the right tools. A large enough bucket with a handy holder for the dryer and washing equipment makes the work easier. A high-quality washer sleeve and dryer are an effective combination for washing even awkward window surfaces ergonomically.

## STEP 3: THE RIGHT ORDER

Clean any dust from the blinds. It is important to start washing from the window frame, from the inside out. Wash the windowpanes from the edges towards the centre to avoid wetting the frame.

### THE PERFECT PRODUCTS TO ACHIEVE BRIGHT WINDOWS

**Kiilto Window** is developed specially for windows and mirrors and it can be found both ready-to-use and as a concentrate.

**Kiilto Biodish** is an all purpose cleaner that can be used not only to washing the dishes but also to clean windows.

Both products are part of the **Kiilto Natura -serie**, which includes products made out of plant based, 100% biodegradable raw materials.

## PRO TIP FROM KIILTO'S EXPERTS

The best time to wash windows is in mild, cloudy weather.

Direct sunlight can dry the detergent too quickly on the surface, making it harder to get good results.

## STEP 4: REMEMBER TO DRY

After washing the glass surface, dry it with a window dryer in long movements. Gently press the window dryer against the surface.

The condition of the dryer rubber makes a significant difference to the final result, so dryer rubbers needs be replaced for professional use after approximately 20 hours of use. A microfibre cloth can be used to dry the rubber. The window washer can be used to collect any runoff.

Avoid wetting the window frame, and finally dry up any spills on the frame with a microfibre cleaning cloth.

## ALL THE TIME: ERGONOMICS AND SAFETY

Keep good ergonomics in mind at every stage of the work. Use an extension arm to avoid unnecessary stretching.

A protective mat can be used during the washing to absorb any water or dirt from the cleaning. It also improves safety by keeping the floor dry.
