PRO**

# Kiilto Pro Hygimon

— Your data-driven assistant for  
infection control

Kiilto Pro Hygimon is an innovative digital system that automates hand hygiene monitoring. Fast and reliable reports help infection control teams to improve quality and patient safety, which will reduce healthcare associated infections and their costs.

## **TURNING HOSPITALS INTO SMART HOSPITALS**

Kiilto Pro Hygimon monitors and collects more accurate data than ever before. The system provides information that will help you to optimize the locations of the hand disinfectant dispensers and bottles on hospital premises and also alerts when the disinfectant is running short and needs a refill.

## GUIDES YOU IN PREVENTING HEALTHCARE-ASSOCIATED INFECTIONS

Kiilto Pro Hygimon is an automated hand hygiene compliance monitoring system (HHCM) which revolutionizes the fight against spreading of infections.

With Kiilto Pro Hygimon, you can create a safer environment both to your staff and your visitors, based on actions taken on accurate data collected on-site.

## HOW KIILTO PRO HYGIMON WORKS?

Kiilto Pro Hygimon anonymously records the use of hand disinfectant dispensers and pump bottles and transfers the collected data to be evaluated. This allows to review staff's actual hand hygiene compliance and note any improvements to be made.

Transponders distinguish between different work groups and measure hand hygiene compliance in accordance with critical hand hygiene standards. Infection control teams gain nearly real time and holistic overview of hospital hand hygiene compliance.

Kiilto Pro Hygimon uses either hospital's internal LAN/Wi-Fi network or its own cellular network which doesn't require any integration into existing IT infrastructure. Data evaluation in cloud-based visual dashboard consisting of easy-to-read graphs and ward maps.

## WHAT DOES KIILTO PRO HYGIMON -SYSTEM DO?

### COLLECTS DATA

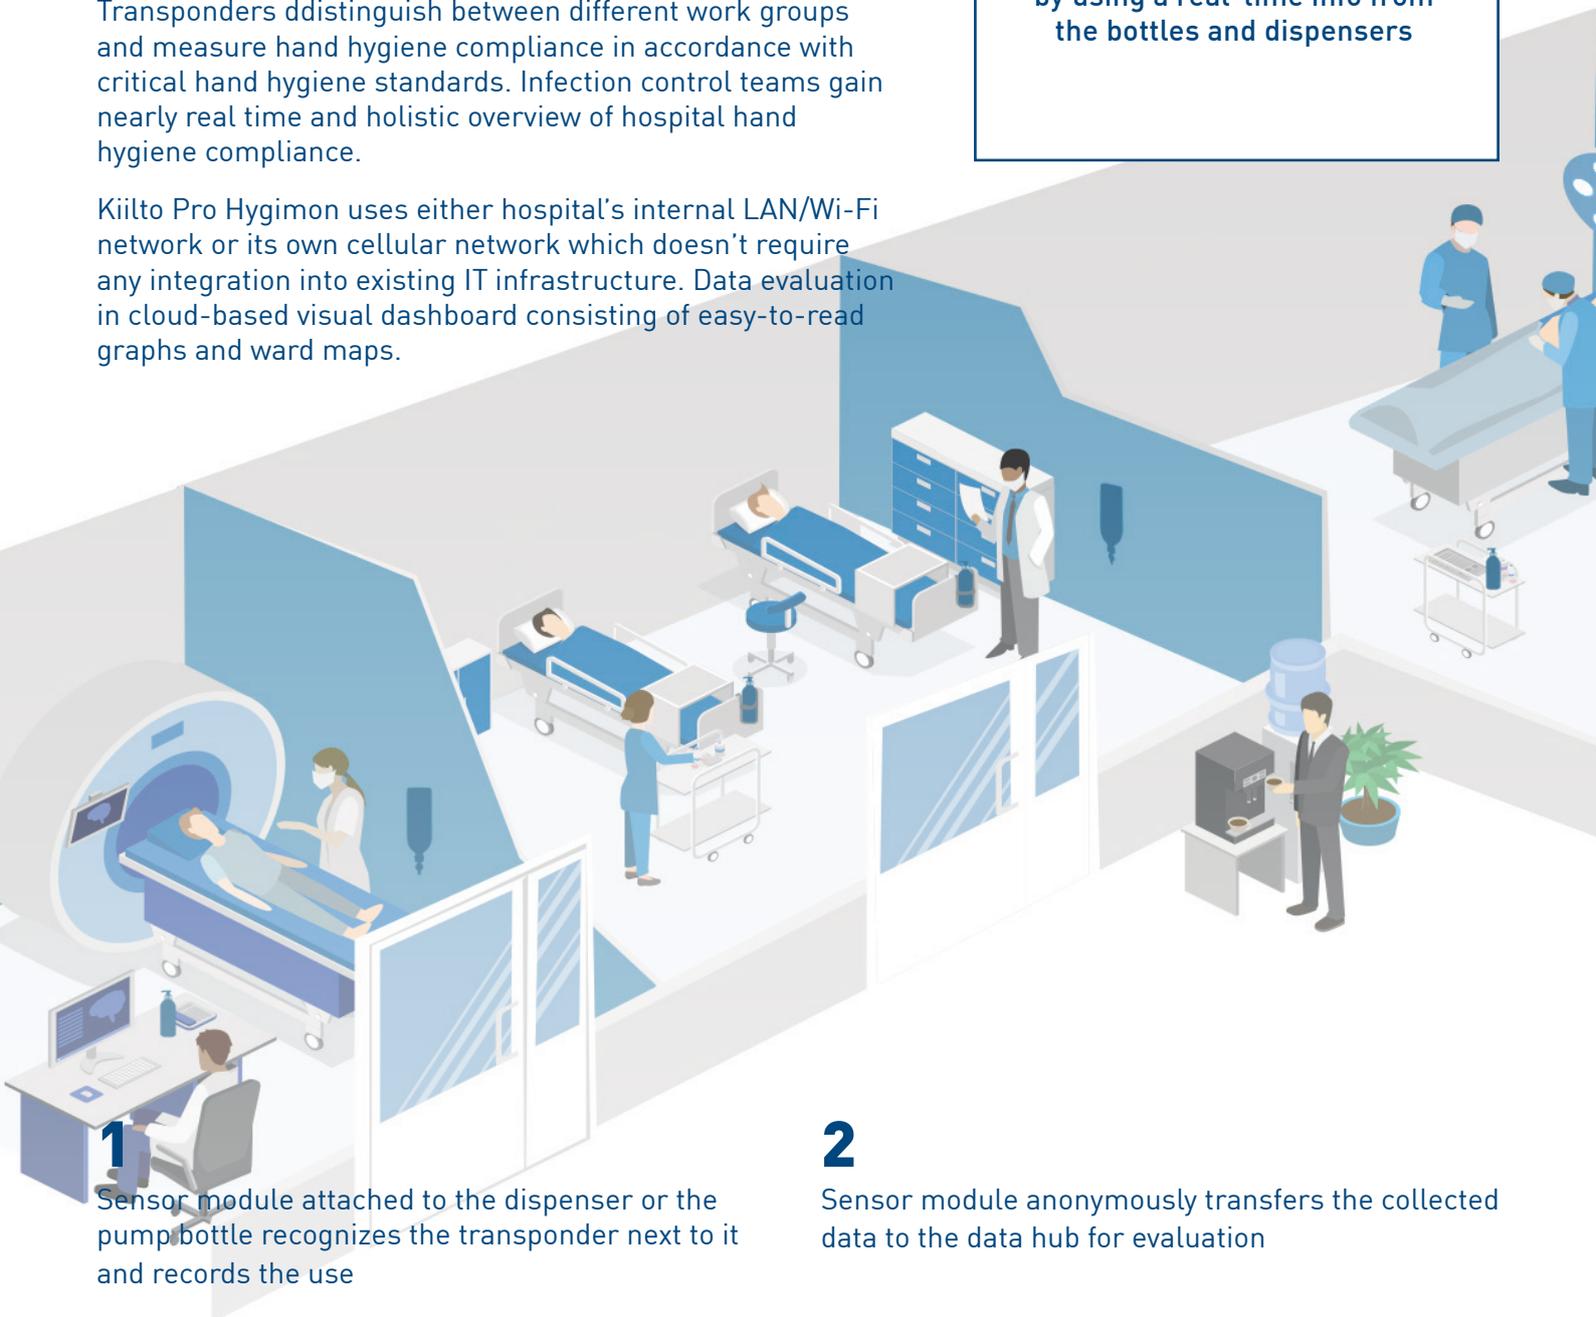

that is objective and provides automated recordings of hygiene indicators

### PROVIDES FEEDBACK

that is data-based and gives accurate information to the ward staff

### MANAGES REFILL NEEDS

for dispensers and bottles by using a real-time info from the bottles and dispensers

## TRANSPONDERS - EASY TO USE

Staff's anonymous smart tags can distinguish different workgroups while all unidentified persons are categorized as guests.

The transponders measure the data anonymously.

Each job group has its own, chosen transponder, so that the different job groups can be sorted out in the data analysis. The transponder is pinned into the clothing and it is then ready-to-use!

After the shift the transponder is returned to the transponder box. All it needs is a disinfection and then it is ready to be used again. The disinfection can be done easily with **Kiilto Pro Easydes Wipes** that are efficient and ready-to-use.

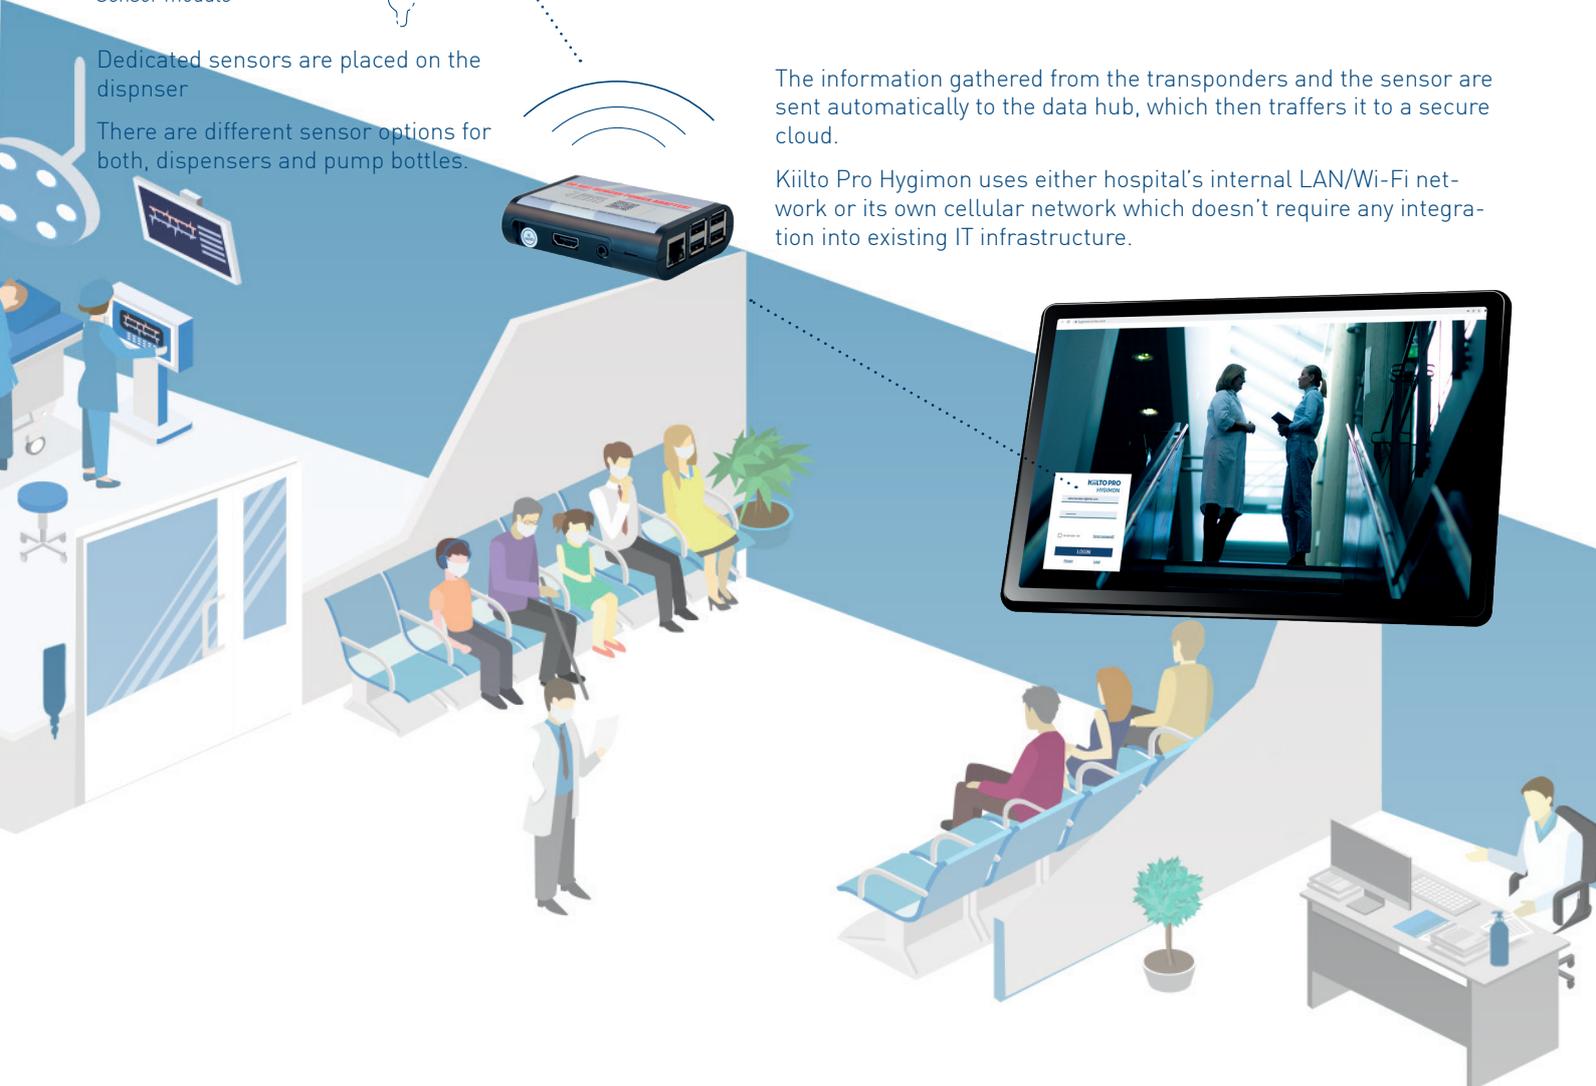

Dedicated sensors are placed on the dispenser

There are different sensor options for both, dispensers and pump bottles.

The information gathered from the transponders and the sensor are sent automatically to the data hub, which then transfers it to a secure cloud.

Kiilto Pro Hygimon uses either hospital's internal LAN/Wi-Fi network or its own cellular network which doesn't require any integration into existing IT infrastructure.

3

The data can be evaluated and the staff's actual hand hygiene compliance reviewed together with notes if any improvements needs to be done

4

The collected data can be filtered according to the chosen transponder group – different colours to signify different job groups

# IMPROVE PATIENT SAFETY WITH KIILTO PRO HYGIMON

With Kiilto Pro Hygimon you'll **increase** actual **hand hygiene** compliance, support **infection control teams** in their work and **reduce** sick leaves
